From STL To Voxels

- Used Common Versatile Multi-purpose Library for C++ (CVMLCPP)
- Takes .stl file and returns a binary file with the given voxel size
- Script to read binary file and output it as ascii.vtk

From STL To Voxels

- Used Common Versatile Multi-purpose Library for C++ (CVMLCPP)
- Takes .stl file and returns a binary file with the given voxel size
- Script to read binary file and output it as ascii.vtk

Load and fixture specification

- Boundary conditions required - how to specify?

From STL To Voxels

- ToPy for topology optimization
- Script for generating .tpd file
- Takes binary output from CVMLCPP and generates ToPy input
 - Non-Voxel cells are set to passive elements
 - Fixture and load nodes set manually at the moment

From STL To Voxels

- ToPy for topology optimization
- Script for generating .tpd file
- Takes binary output from CVMLCPP and generates ToPy input
 - Non-Voxel cells are set to passive elements
 - Fixture and load nodes set manually at the moment

Current status

- What do we have so far?

Current status

- What do we have so far?
- What if we try to pass it to an engineer?

How to make CAD understand our data?

B-Spline

$$\vec{S}(u, v) = \sum_{i,j=1}^{n,m} \vec{C}_{i,j} N_i^p(u) N_j^p(v),$$

where p – degree of the B-Spline surface and n, m – number of control points in each direction.

B-Splines

- offer great flexibility for handling arbitrary shapes
- are CAD-standard

Engineers are working with CAD

B-Spline Fitting

Goal:

Find B-Spline representation of our data!

$$\vec{S}(u_\alpha, v_\alpha) \approx \vec{P}_\alpha$$

B-Spline Fitting

Goal:

Find B-Spline representation of our data!

$$\vec{S}(u_\alpha, v_\alpha) \approx \vec{P}_\alpha$$

B-spline fitting: Least squares

The task:

Find control points $C_{i,j}$, such that the B-Spline surface

$$\vec{S}(u, v) = \sum_{i,j=1}^{n,m} \vec{C}_{i,j} N_i^p(u) N_j^p(v)$$

approximates our dataset of points $\{\vec{P}_\alpha\}$.

This leads to *minimization problem*:

$$\vec{S}(u_\alpha, v_\alpha) \approx \vec{P}_\alpha \forall \alpha \leftrightarrow \min_{\vec{C}_{i,j} \in \mathbb{R}^3} \sum_{\alpha} \|\vec{P}_\alpha - \vec{S}(u_\alpha, v_\alpha)\|_2$$

B-spline fitting: Least squares (cont.)

Resulting system looks like:

$$\sum_{i,j=1}^{n,m} \vec{C}_{i,j} N_i^p(u_\alpha) N_j^p(v_\alpha) \approx \vec{P}_\alpha \quad \forall \alpha$$

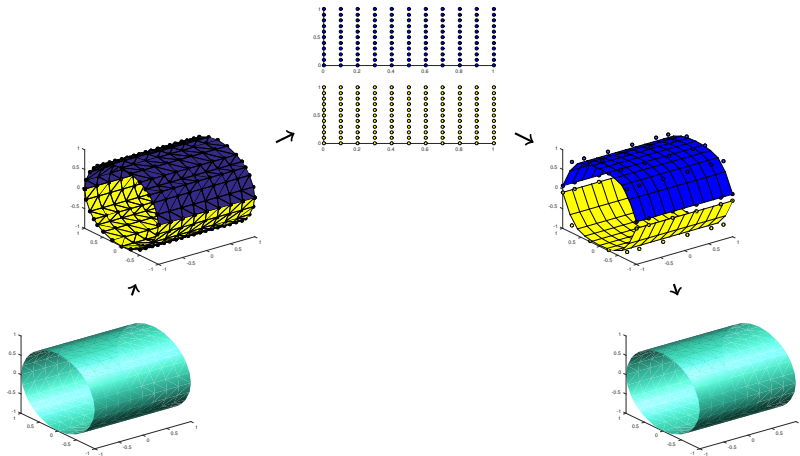

Or, in matrix-vector form:

$$AC \approx P$$

Our system matrix A depends on $\{u_\alpha, v_\alpha\}$

B-Spline Fitting pipeline according to Becker, Schäfer, Jameson

How to deal with a complex shape?

B-Spline Fitting: Open questions

- How to distribute our data into patches?
- How to parameterize obtained patches?
- How to connect several patches after fitting?

B-Spline Fitting pipeline according to M. Eck & H. Hoppe

B-Spline Fitting: Parameter correction

The task:

For *fixed* control points $C_{i,j}$, find an optimal parametrization $\{u_\alpha, v_\alpha\}$.

Summary

What's done?

- first part of the pipeline from CAD model to optimized voxel model
- identified crucial points in the fitting problem

Outlook

What's next?

- further work on M.Eck & H.Hoppe paper
- search for algorithm which considers voxel geometry
